

Invite you to join us at a seminar and social, on:

THE BEGINNING OF THE END OF THE RENEWABLE ENERGY FANTASY

by Jo Nova*

***The increase in AI will
make the use and cost
of energy soar.***

***AI companies are
restarting nuclear
and coal plants in
the USA.***

***But with unreliable costly renewable energy
Australia will miss out on the AI tech revolution.***

**Renewables are so bad and cost so much we wouldn't wish them on our
enemies though they happily wish them on us.**

It is politics and vested interests not science.

Wednesday 25th February 2026

Where: RSL Hall, 22 Leake Street, Belmont

From: 6.15pm for 7:00pm start

Entry \$15 including pies, pizzas and sandwiches on arrival, coffee and cakes later.
Drinks at club bar prices. RSVP essential and please bring a friend.

THE BEGINNING OF THE END OF THE RENEWABLES FANTASY

“ The existential race to build the AI that will conquer the world has driven up competition and costs for every part of an electricity grid. And high prices are driving people to get subsidized solar panels, which everyone else must pay for in electricity bills – we are caught in a rising death spiral in costs. In desperation billions of dollars are being thrown at subsidies for batteries that only serve the rich. And thousands of kilometers of high voltage transmission lines must be built that generate no kilowatts, and serve no one but the renewables industry. Meanwhile high energy industries are leaving Australia, profits and jobs headed for China. But all around the world other countries are building gas plants, nuclear power, burning record amounts of coal, and giving up on EV schemes. Australia is the last major coal producer on the suicidal mission to kill coal.

Renewables are so bad and cost so much we wouldn’t wish them on our enemies, though they would happily wish them on us, and maybe that is the point.”
